Ladies and gentlemen,

My name is Goran Bjelobrk, and I am interested in the position of a Junior PHP Developer (backand). A year ago I was at a professional practice, where I learned the basics of frontend and backend technique.

Sience 2001, I have learned to make websites. For graduation work in high school, I made the website and wapsite, which allows users to download monochromatic images to mobile phones. Because of the desire for further improvement, I graduated The Faculty of Technical Sciences in Novi Sad (Serbia), Department of Industrial Engineering and Management - Information, Management and Communication Systems with a duration of 5 years. My degree is recognized in the Federal Republic of Germany, labeled H+. In college, first three years I studied the all enterprise functions, as well as Mathematics, Statistics and Fundamentals of Computer Science and Programming. The other two years I studied courses related to the design of information systems.There I studied Relational Database, Object Oriented Informations Technologies and Communication Systems Design.

On the professional practice I learned techniques of frontend: HTML, CSS, jQuery and Responsive web design.To apply learned techniques I made presentation site for rent the house on the sea. On the website I applied certain limitations for sending e-mail, as well as the option of selecting one of four languages.To design a site I have used Compass (Sass-based Stylesheet Framework).

I used PHP language, as the most common server language. Using PHP I made a application for keeping records of The Computer service. I used PDO (PHP Data Object), MVC (Model View Contoller) approach and MySQL relational database. When I had mastered all the basic techniques of PHP, then I started to the study Symfony 2 frameworks. I made a project whose purpose is keeping vCard in to the database, as well as an adequate presentation of all contacts in the database with function of export and inport contacts in the vCard format. Similarly Google Contact function in Gmail. Design of this project is unfortunately not complete, but the functionality is.

For development, I used Ubuntu Linux operating system, NetBeans as the main text editor, Apache application server and MySQL relational database with Workbench.
I would like to accept the position of a Junior PHP Developer, in the desire to learn more about these techniques, as well as to gain adequate experience. I would welcome the opportunity to discuss this with you further but if you have any questions before hand, please do not hesitate to contact me and I will be happy to answer anything you need to know related to my previous experience.

Sincerely,
Goran Bjelobrk
